Electric Actuators  
for Nuclear  
Power Plants

# Quality Without compromise

The SIWI M7636 series is intended for use outside the containment area while the SIWI-AS M7637 series has been designed for inside containment applications. As well as having important additional safety functions, the SIWI-AS actuators are designed to be fault-proof when using design-basis accident analysis criteria, for example LOCA (Loss of Coolant Accidents).

Safety is of the utmost importance in nuclear power plants and quality standards cannot be compromised.

Recognising this fact, SIPOS actuators have been designed specifically for use in the nuclear industry.

To meet the demands of different actuator applications for the nuclear sector, two SIPOS product ranges have been developed.

SIPOS actuators meet nuclear industry standards and the company's expertise is widely recognised within the nuclear market. Five of the top ten largest nuclear power plants globally have selected SIPOS electrical actuators over the last five decades. In addition, it is testament to the quality and reliability of the product that SIPOS actuators are used in the majority of European countries with nuclear power plants.

## Nuclear power plant schematic

# The right solution

## For every application

SIPOS actuators provide a flexible control solution, compatible with a wide range of different valves and applications. From simple opening and closing functionality to reliable valve regulation at the required speed and cut-off torque, SIPOS has the right actuator for any application.

The company works closely with its customers to develop complete systems which take into account both installation and operational plant requirements to deliver practical, customer focused solutions.

| Typ:                                  |                   | C       | E   | F   | G   | M   | N   | S      | U    |

## Refined technology Down to the finest detail

Reliability and quality that focuses on the fine detail characterises SIPOS' actuators. With 50 years knowledge and experience in manufacturing electric actuators for nuclear power plants, SIPOS Aktorik understands how each individual element contributes to the quality of the complete actuator. Every SIWI-AS component is designed to be fault-proof and the user can be confident of the product quality, as every part is individually tested during the production process. SIPOS is proud to highlight the fact that its products have a proven functional safety track record dating back over five decades.

# The right interface

## For every connection

Each actuator is tailored for individual operating environments. Comprehensive customisation ensures long-term system reliability during plant operation. For example, the electrical connections of SIWI-AS actuators have pressure-tight cable entries to provide trouble-free service, capable of withstanding extreme environmental conditions. This ensures that the actuator functions perfectly, even in adverse fault scenarios.

### Electrical interface

SIPOS supplies many different types of connection to ensure interfaces are available for an extremely diverse range of valves. The connectors comply with ISO 5210 / DIN 3210.

### Mechanical connector types

## Documented safety Detailed verification

additionally stipulates the need for calculative verification records of all components in the mechanical chain (power flow). This involves the determination and verification of the predefined safety factors/service life values of all the components in accordance with recognised calculation methods.

Relevant industry norms and standards stipulate strict requirements for the quality of actuators used in nuclear power plants. Different industry standards have varying criteria for the range of operating conditions in which the actuator must safely function. Unlike other standards, KTA 3504
